

Creating an AI-Generated Advertisement Video for an MSI Laptop Using Google Flow

Introduction

Google Flow is an AI-powered filmmaking tool developed by Google Labs that allows users to generate cinematic-quality video clips directly from natural-language text prompts and reference images. It is built on top of Google DeepMind's Veo video model, Imagen for image generation, and Gemini for prompt understanding. Flow lowers the cost and skill barrier of professional video production, making it well-suited for student projects, advertising mock-ups, and short promotional content.

This document explains, step by step, how to use Google Flow to create a short advertisement video for an MSI laptop. The procedure covers account setup, project creation, prompt writing, scene generation, editing, and exporting the final video.

Objective

To design and generate a short (approximately 15–30 second) AI-generated advertisement video that showcases an MSI laptop, highlighting its design, display, and performance, using Google Flow as the primary video-generation tool.

Tools and Requirements

- **Hardware:** A computer with a stable internet connection and an updated web browser (Chrome recommended).
- **Software / Platforms:** Google Flow (labs.google/flow), Google Gemini (for prompt brainstorming), and any basic video editor such as CapCut, DaVinci Resolve, or Clipchamp for stitching clips.
- **Account:** A Google account with an active Google AI Pro or Google AI Ultra subscription. The Ultra plan provides higher generation limits and access to the latest Veo model.
- **Reference Material:** High-resolution images of the chosen MSI laptop model (e.g., MSI Stealth, MSI Katana, MSI Raider) downloaded from the official MSI website, plus a written script or rough storyboard of the advertisement.

Overview of Google Flow

Before starting the procedure, it is useful to understand the major components of Google Flow:

- **Veo:** The underlying generative video model responsible for producing realistic motion, physics, and visual quality.
- **Imagen / Nano Banana:** Image generation models used to create still frames and reference assets.
- **Gemini:** A language model that helps interpret and refine the user's text prompt.
- **Scenebuilder:** An editing area for extending, trimming, and chaining shots.
- **Ingredients:** Reusable visual assets (characters, products, backgrounds) that can be inserted across multiple shots to maintain consistency.

- **Frames:** Start-frame and end-frame controls that let the user define how a shot begins and ends, enabling smooth transitions.

Step-by-Step Procedure

Step 1: Plan the Advertisement Concept

Begin by planning the advertisement on paper before opening Google Flow. AI-generated video is far easier to direct when the concept is well-defined in advance.

- **Define the target audience:** for example, gamers, content creators, or engineering students.
- **Choose the MSI model:** such as MSI Stealth 16, MSI Katana 15, or MSI Raider GE78.
- **Decide the tone:** energetic and gaming-oriented, sleek and professional, or futuristic and cinematic.
- **Write a short script:** a 3-to-5 shot storyboard. For example: (1) laptop appears in a dark studio, (2) RGB keyboard lights up, (3) screen explodes with gaming visuals, (4) tagline appears.

Step 2: Sign In and Access Google Flow

1. Open a web browser and navigate to **labs.google/flow**.
2. Click **Get Started** and sign in using a valid Google account.
3. If prompted, subscribe to Google AI Pro or Ultra. The subscription unlocks generation credits required for video creation.
4. Once signed in, the Google Flow dashboard will appear, showing existing projects and an option to create a new one.

Step 3: Create a New Project

5. Click **New Project** on the dashboard.
6. Name the project appropriately, for example *“MSI Laptop Advertisement”*.
7. Select the aspect ratio. Use **16:9** for YouTube and websites, or **9:16** for Instagram Reels, YouTube Shorts, and TikTok.
8. Choose the video model. The latest Veo version generally produces the most realistic results and supports synchronized audio.

Step 4: Upload Ingredients (Reference Assets)

Since Veo cannot reliably re-imagine a real MSI laptop from text alone, providing reference images is critical for brand accuracy.

9. Inside the project, locate the **Ingredients** panel.
10. Click **Add Ingredient** and upload high-quality product photos of the selected MSI laptop, ideally from multiple angles.
11. Optionally upload reference images of the desired environment, such as a dark studio, an esports arena, or a futuristic workspace.
12. Label each ingredient clearly (for example, *“MSI_Stealth_front”*) so it can be referenced in later prompts.

Step 5: Write a Detailed Prompt

The quality of the generated video depends almost entirely on the prompt. A well-structured prompt typically describes the subject, the action, the camera movement, the lighting, the environment, and the desired audio.

Recommended Prompt Structure

- **Subject:** what is in the shot (the MSI laptop and any supporting elements).
- **Action:** what is happening (lid opening, keyboard lighting up, camera rotating).
- **Camera:** shot type and motion (close-up, slow dolly-in, 360-degree orbit).
- **Lighting:** mood and color (rim lighting, neon RGB glow, golden hour).
- **Environment:** background setting (dark studio, gaming arena, glass desk).
- **Style and Audio:** cinematic, hyper-realistic, 4K, with bass hit or ambient synth.

Example Prompt for an MSI Laptop Advertisement

An MSI Stealth 16 gaming laptop sits on a rotating glass pedestal in a dark cinematic studio. The lid slowly opens and the RGB backlit keyboard glows red. The display lights up to reveal an intense gaming scene. The camera performs a slow 360-degree orbit around the laptop with shallow depth of field, soft rim lighting on the brushed aluminum body, and subtle reflections on the floor. Style: hyper-realistic, cinematic, 4K, 24 fps, 16:9. Audio: cinematic bass hit followed by ambient electronic synth. No subtitles.

Step 6: Generate the First Scene

13. Paste the prompt into the prompt box at the bottom of the Flow workspace.
14. Attach the MSI ingredient by clicking the + or **Add Ingredient** icon next to the prompt box.
15. Set the desired generation length (typically up to 8 seconds per clip).
16. Click **Generate**. Flow will return one or more video previews after a short rendering period.
17. Review each output and select the best clip. If none are satisfactory, refine the prompt and regenerate.

Step 7: Add More Shots Using Scenebuilder

A complete advertisement is usually a sequence of short shots. Google Flow's Scenebuilder allows the user to add more shots while keeping the same project context.

- **Extend:** lengthens the current clip by continuing the action from the final frame.
- **Jump To:** moves the same subject (the MSI laptop) into a completely different setting, preserving its appearance.
- **Frames to Video:** uses a start frame and end frame to generate a smooth transition between two specific images.

Generate three to five short clips covering different angles and moments of the advertisement, such as: laptop reveal, keyboard close-up, gameplay on screen, user reaction, and a final hero shot with the MSI logo.

Step 8: Review, Refine, and Regenerate

- Inspect each generated clip for visual artifacts, distorted text, or incorrect MSI branding.

- If a clip looks inaccurate, edit the prompt to be more specific or replace the reference ingredient.
- Use shorter, clearer sentences and concrete cinematic terms (“dolly-in”, “close-up”, “rim light”) instead of vague adjectives.
- Maintain visual consistency by reusing the same ingredient and similar lighting descriptions across all shots.

Step 9: Download the Clips

18. Hover over the chosen clip and click the **Download** icon.
19. Save the file in MP4 format to a dedicated project folder.
20. Repeat for every approved clip in the storyboard.

Step 10: Edit and Finalize the Advertisement

Google Flow generates raw clips, but the final advertisement usually requires light post-production work in a video editor.

- **Stitch the clips:** import them into CapCut, DaVinci Resolve, or Clipchamp and arrange them according to the storyboard.
- **Add the MSI logo:** overlay the official MSI dragon logo and the tagline (for example, “True Gaming. True Performance.”).
- **Add captions:** include short on-screen text such as model name, key features, and a call to action.
- **Add background music:** use royalty-free music that matches the tone of the advertisement.
- **Export:** render the final video in 1080p or 4K MP4 for submission.

Final Output

Sample Storyboard for the MSI Advertisement

- **Shot 1 (0:00–0:04):** MSI Stealth 16 emerges from darkness on a rotating pedestal, illuminated by a single spotlight.
- **Shot 2 (0:04–0:09):** Close-up of the RGB keyboard lighting up in sequence, with reflections on the brushed-metal palm rest.
- **Shot 3 (0:09–0:14):** Screen explodes with high-frame-rate gameplay; a particle effect bursts toward the camera.
- **Shot 4 (0:14–0:20):** Camera pulls back to reveal the laptop in the hands of a confident young gamer in a neon-lit room.
- **Shot 5 (0:20–0:25):** Final hero shot with the MSI dragon logo, model name, and tagline appearing on screen.

Tips and Best Practices

- Write prompts as if directing a real cinematographer; include shot type, camera motion, lighting, and mood.
- Always upload official product images as ingredients to keep the laptop visually accurate.
- Generate multiple variations of each shot and keep only the best one.
- Remember that each clip is limited to a few seconds; plan the advertisement as a series of short shots.
- Use Gemini separately to brainstorm prompts, taglines, and shot descriptions before pasting them into Flow.
- Avoid prompts that produce on-screen text inside the video; Veo often misspells words. Add text in the editor instead.
- Track credit usage carefully, as each generation consumes a portion of the monthly quota.

Limitations to Keep in Mind

- Generated text on screen, such as logos or model numbers, is frequently distorted and should be replaced in post-production.
- Each shot is short (commonly up to 8 seconds), so long advertisements must be assembled from multiple clips.
- Maintaining perfect consistency of the laptop across shots can be challenging; reusing the same ingredient image is essential.
- Generation requires an active paid subscription and a stable internet connection.

Conclusion

Google Flow makes it possible to produce a polished MSI laptop advertisement video without owning a camera, lighting equipment, or a film studio. By combining clear planning, detailed prompts, well-chosen ingredients, and basic post-production editing, even a single student can deliver a professional-looking advertisement. The procedure outlined in this document provides a reusable framework that can be adapted for other products, brands, or creative video projects.
